

Forecast Briefing

A strong area of low pressure slides to the northeast of the area on Friday, with cold temperatures and blustery winds expected to build in. Freezing temperatures are likely on Friday morning for a few hours near sunrise. The weather pattern then moderates, with the next chance of precipitation Saturday into Sunday. Most forecast model guidance keeps the brunt of precipitation south of the area at this time. Additional rain and storm chances are possible next week.

Hazards Overview

Hazard	Severity	Timing	Description
Freeze	Notable	Thru Fri AM	Freezing temperatures likely
Showers	Uncertain	Saturday-Sunday	0.10" - 0.20" Rain possible

Forecast Discussion

Freezing temperatures are expected this morning, in the wake of the strong storm system which impacted the area this week. A storm system passes mostly to the south and east of the area from Saturday into Sunday - some fringe bands of light rain are possible, but forecast models are in good agreement that the brunt of the system will miss the area. Temperatures are then expected to moderate toward more seasonal values during the early to middle part of next week. The next chance for rain comes during the middle of next week, when a storm system develops out of the Intermountain

West. Light to moderate rainfall amounts are possible as that system traverses the Plains states from Tuesday through Thursday.
